

An Invitation

Laboratory for Bioresources (BRR; Faculty of Agriculture, Shinshu University) are seeking students who are interested in learning realm of our particular research interests, and in conducting intensive studies to discover/create novel idea into reality. We would also welcome those who have been learning about their specialized fields where it is seemingly unrelated to our present research area, based on our inherent management policy— jointing and exchanging your idea one by one, little by little.

Our present research area are animal nutrition and applied microbiology. Thanks to contributions of members and great helps from people along with us, we have created new findings and a sort of techniques. We sometimes imagine that very limited number (in some instances, “nobody”) in the world would commit research topics what we are involving in. Currently (as of 2020) around 10 lab members here including 2 foreign students it is not yet large, I am truly confident with gradual expansion and diversity of such attractive members who have taken their different path of study, life experience, and different way of thinking. It is of course strong driving force to take us ourselves into a world-class research.

We also think it important for letting you who have learned something different from our specialty, look into different worlds and get things as your own, to dramatically deserve yourself. The process is not easy, but when you dare to introduce your skills and professionalism into a different field of research where we are carrying, you can imagine what it becomes after these reactions.

Don't you love to see it together? We always hope to enjoy with you such an unexpected encounter that we have yet known the answer.

Yutaka Uyeno

Associate Professor

Faculty of Agriculture, Shinshu University
